Foreword

This part of ISO 9735 was prepared by the UN/ECE Trade Division (as UN/EDIFACT) and was adopted, under a special "fast-track procedure", by Technical Committee ISO/TC 154, *Documents and data elements in administration, commerce and industry.*

Whereas this part supersedes the earlier publications, and shall use a version number of "4" in the mandatory data element 0002 (Syntax version number) in the segment UNB (Interchange header), interchanges continuing to use the syntax defined in the earlier published versions shall use the following Syntax version numbers, in order to differentiate them from each other and from this part:

ISO 9735:1988 — Syntax version number: 1

ISO 9735:1988 (amended and reprinted in 1990) — Syntax version number: 2

ISO 9735:1988 (amended and reprinted in 1990) plus Amendment 1:1992 — *Syntax version number: 3*

ISO 9735 consists of the following parts, under the general title *Electronic* data interchange for administration, commerce and transport (*EDIFACT*) — Application level syntax rules (Syntax version number: 4):

- Part 1: Syntax rules common to all parts, together with the syntax service directories for each of the parts
- Part 2: Syntax rules specific to batch EDI
- Part 3: Syntax rules specific to interactive EDI
- Part 4: Syntax and service report message for batch EDI (message type CONTRL)
- Part 5: Security rules for batch EDI (authenticity, integrity and nonrepudiation of origin)
- Part 6: Secure authentication and acknowledgement message (message type - AUTACK)
- Part 7: Security rules for batch EDI (confidentiality)
- Part 8: Associated data in EDI
- Part 9: Security key and certificate management message (message type KEYMAN)

Further parts may be added in the future.

Annex A forms an integral part of this part of ISO 9735. Annexes B to E are for information only.

Introduction

This part of ISO 9735 includes the rules at the application level for the structuring of data in the interchange of electronic messages in an open environment, based on the requirements of either batch or interactive processing. These rules have been agreed by the United Nations Economic Commission for Europe (UN/ECE) as syntax rules for Electronic Data Interchange for Administration, Commerce and Transport (EDIFACT) and are part of the United Nations Trade Data Interchange Directory (UNTDID) which also includes both batch and interactive Message Design Guidelines.

Communications specifications and protocols are outside the scope of this part of ISO 9735.

This is a new part, which has been added to ISO 9735. It provides an optional capability of securing batch EDIFACT structures i.e. messages, packages, groups or interchanges, by means of a secure authentication and acknowledgement message.

Electronic data interchange for administration, commerce and transport (EDIFACT) — Application level syntax rules — (Syntax version number: 4) —

Part 6:

Secure authentication and acknowledgement message (message type - AUTACK)

1 Scope

This part of ISO 9735 for EDIFACT security defines the secure authentication and acknowledgement message AUTACK.

2 Conformance

Conformance to a standard means that all of its requirements, including all options, are supported. If all options are not supported, any claim of conformance shall include a statement which identifies those options to which conformance is claimed.

Data that is interchanged is in conformance if the structure and representation of the data conform to the syntax rules specified in this part of ISO 9735.

Devices supporting this part of ISO 9735 are in conformance when they are capable of creating and/or interpreting the data structured and represented in conformance with this part of ISO 9735.

Conformance to this part of ISO 9735 shall include conformance to Part 1, Part 2 and Part 5 of ISO 9735.

When identified in this part of ISO 9735, provisions defined in related standards shall form part of the conformance criteria.

3 Normative references

The following standards contain provisions which, through reference in this text, constitute provisions of this part of ISO 9735. At the time of publication, the editions indicated were valid. All standards are subject to revision, and parties to agreements based on this part of ISO 9735 are encouraged to investigate the possibility of applying the most recent editions of the standards indicated below. Members of IEC and ISO maintain registers of currently valid International Standards.

ISO 9735-1:1998, Electronic data interchange for administration, commerce and transport (EDIFACT) — Application level syntax rules — Part 1: Syntax rules common to all parts, together with syntax directories for each of the parts.

ISO 9735-2:1998, Electronic data interchange for administration, commerce and transport (EDIFACT) — Application level syntax rules (Syntax version number: 4) — Part 2: Syntax rules specific to batch EDI.

ISO 9735-5:1998, Electronic data interchange for administration, commerce and transport (EDIFACT) — Application level syntax rules (Syntax version number: 4) — Part 5: Security rules for batch EDI (authenticity, integrity and non-repudiation of origin).

4 Definitions

For the purposes of this part of ISO 9735, the definitions in ISO 9735-1:1988, annex A and in ISO 9735-5:1998, annex A apply.

5 Rules for the use of the secure authentication and acknowledgement message

5.1 Functional definition

AUTACK is a message authenticating sent, or providing secure acknowledgement of received interchanges, groups, messages or packages.

A secure authentication and acknowledgement message can be used to:

- a) give secure authentication, integrity or non-repudiation of origin to messages, packages, groups or interchanges.
- b) give secure acknowledgement or non-repudiation of receipt to secured messages, packages, groups or interchanges.

5.2 Field of application

The secure authentication and acknowledgement message (AUTACK) may be used for both national and international trade. It is based on universal practice related to administration, commerce and transport, and is not dependent on the type of business or industry.

5.3 Principles

The applied security procedures shall be agreed to by trading partners and specified in an interchange agreement.

The secure authentication and acknowledgement message (AUTACK) applies security services to other EDIFACT structures (messages, packages, groups or interchanges) and provides secure acknowledgement to secured EDIFACT structures. It can be applied to combinations of EDIFACT structures that need to be secured between two parties.

The security services are provided by cryptographic mechanisms applied to the content of the original EDIFACT structures. The results of these mechanisms form the body of the AUTACK message, supplemented by relevant data such as references of the cryptographic methods used, the reference numbers for the EDIFACT structures and the date and time of the original structures.

The AUTACK message shall use the standard security header and trailer groups.

The AUTACK message can apply to one or more messages, packages or groups from one or more interchanges, or to one or more interchanges.

5.3.1 Use of AUTACK for the authentication function

An AUTACK message used as an authentication message shall be sent by the originator of one or more other EDIFACT structures, or by a party having authority to act on behalf of the originator. Its purpose is to facilitate the security services defined in Part 5 of ISO 9735, i.e. authenticity, integrity, and non-repudiation of origin of its associated EDIFACT structures.

An AUTACK authentication message can be implemented in two ways. The first method conveys the hashed values of the referenced EDIFACT structures secured by the AUTACK itself; the second uses the AUTACK only to convey digital signatures of the referenced EDIFACT structures.

5.3.1.1 Authentication using hash values of the referenced EDIFACT structures

The secured EDIFACT structure shall be referenced in an occurrence of the USX (security references) segment. For each USX there shall be at least one corresponding USY (security on references) segment which contains the security result, for example the hash value, of the security function performed on the referenced EDIFACT structure.

Details about the security function performed shall be contained in the AUTACK security header group. The USY and USH segments for the referenced EDIFACT structure shall be linked using security reference number data elements in both segments.

As a final step, all the information conveyed in the AUTACK shall be secured using at least one pair of security header and security trailer groups.

Note:

AUTACK uses the USX segment to reference one or more messages, packages or groups in one or more interchanges, or to reference an entire interchange. For each USX segment a corresponding USY segment contains the result of the hashing, authentication or non-repudiation method applied to the referenced EDIFACT structure.

5.3.1.2 Authentication using digital signatures of the referenced EDIFACT structures

The secured EDIFACT structure shall be referenced in an occurrence of the USX (security references) segment. For each USX at least one corresponding USY (security on references) segment, which contains the digital signature of the referenced EDIFACT structure, shall be present. Details about the security function performed shall be contained in the AUTACK security header group. Because a single referenced EDIFACT structure may be secured more than once, the related USY and security header group shall be linked using security reference number data elements in both segments.

If the digital signature of the referenced EDIFACT structure is contained in AUTACK (rather than just a hash value), the AUTACK does not itself require to be secured.

5.3.2 The use of AUTACK for the acknowledgement function

An AUTACK message used as an acknowledgement message shall be sent by the recipient of one or more previously received secured EDIFACT structures, or by a party having authority to act on behalf of the recipient. Its purpose is to facilitate confirmation of receipt, validation of integrity of content, validation of completeness and/or non-repudiation of receipt of its associated EDIFACT structures.

The acknowledgement function shall be applied only to secured EDIFACT structures. The secured EDIFACT structure shall be referenced in an occurrence of the USX (security references) segment. For each USX there shall be at least one corresponding USY (security on references) segment which contains either the hash value or the digital signature of the referenced EDIFACT structure. The USY shall be linked to a security header group of the referenced EDIFACT structure, or of an AUTACK message securing it, by using security reference number data element. The corresponding security header related to the referenced EDIFACT structure contains the details of the security function performed on the referenced EDIFACT structure by the sender of the original message.

As a final step in generation of the acknowledgement message, all the information conveyed in the AUTACK shall be secured using at least one pair of security header and security trailer groups.

AUTACK may also be used for non-acknowledgement in case of problems with the verification of the security results.

Note :

Secure acknowledgement is only meaningful for secured EDIFACT structures. Securing EDIFACT structures is accomplished by the use of either integrated security segments (see Part 5 of ISO 9735) or AUTACK authentication.

To prevent endless loops, an AUTACK used for the acknowledgement function shall not require its recipient to send back an AUTACK acknowledgement message.

5.4 Message definition

5.4.1 Data segment clarification

0010 UNH, Message header

A service segment starting and uniquely identifying a message. The message type code for the secure authentication and acknowledgement message is AUTACK. The data element message type sub-function identification shall be used to indicate the usage of the

AUTACK function as either authentication, acknowledgement or refusal of acknowledgement.

Note: messages conforming to this document must contain the following data in segment UNH, composite S009:

Data element 0065 AUTACK 0052 4 0054 1

0051 UN

0020 Segment Group 1: USH-USA-SG2 (security header group)

A group of segments identifying the security service and security mechanisms applied and containing the data necessary to carry out the validation calculations (as defined in Part 5 of ISO 9735).

This segment group shall specify the security service and algorithm(s) applied to the AUTACK message or applied to the referenced EDIFACT structure.

Each security header group shall be linked to a security trailer group, and some may be linked additionally to USY segments.

0030 USH, Security header

A segment specifying a security service applied to the message/package in which the segment is included, or to the referenced EDIFACT structure (as defined in Part 5 of ISO 9735).

The security service data element shall specify the security function applied to the AUTACK message or the referenced EDIFACT structure:

- the security services: message origin authentication and non-repudiation of origin shall only be used for the AUTACK message itself.
- the security services: referenced EDIFACT structure integrity, referenced EDIFACT structure origin authentication and referenced EDIFACT structure non-repudiation of origin shall only be used by the sender to secure the AUTACK referenced EDIFACT structures.
- the security services: receipt authentication and non-repudiation of receipt shall only be used by the receiver of secured EDIFACT structures to secure the acknowledgement.

The scope of security application of the security service shall be specified, as defined in Part 5 of ISO 9735. In an AUTACK message, there are four possible scopes of security application:

- the first two scopes are as defined in Part 5 of ISO 9735 section 5.
- the third scope includes the whole EDIFACT structure, in which the scope of the security application is from the first character of the referenced message, package, group or interchange (namely a "U") to the last character of the message, package, group or interchange, inclusive.
- the fourth scope is user defined, in which scope the security application is defined in an agreement between sender and receiver.

0040 USA, Security algorithm

A segment identifying a security algorithm, the technical usage made of it, and containing the technical parameters required (as defined in Part 5 of ISO 9735).

0050 Segment Group 2: USC-USA-USR (certificate group)

A group of segments containing the data necessary to validate the security methods applied to the message/package, when asymmetric algorithms are used (as defined in Part 5 of ISO 9735).

0060 USC, Certificate

A segment containing the credentials of the certificate owner and identifying the certification authority which has generated the certificate (as defined in Part 5 of ISO 9735).

0070 USA, Security algorithm

A segment identifying a security algorithm, the technical usage made of it, and containing the technical parameters required (as defined in Part 5 of ISO 9735).

0080 USR, Security result

A segment containing the result of the security functions applied to the certificate by the certification authority (as defined in Part 5 of ISO 9735).

0090 USB, Secured data identification

This segment shall contain identification of the interchange sender and interchange recipient, a security related timestamp of the AUTACK and it shall specify whether a secure acknowledgement from the AUTACK message recipient is required or not. If one is required, the message sender will expect an AUTACK acknowledgement message to be sent back by the message recipient.

The interchange sender and interchange recipient in USB shall refer to the sender and the recipient of the interchange in which the AUTACK is present, in order to secure this information.

0100 Segment group 3: USX-USY

This segment group shall be used to identify a party in the security process and to give security information on the referenced EDIFACT structure.

0110 USX, Security references

This segment shall contain references to the party involved in the security process.

The composite data element security date and time may contain the original generation date and time of the referenced EDIFACT structure.

If data element 0020 is present and none of: 0048, 0062 and 0800 are present, the whole interchange is referenced.

If data elements 0020 and 0048 are present and none of: 0062 and 0800 are present, the group is referenced.

0120 USY, Security on references

A segment containing a link to a security header group and the result of the security services applied to the referenced EDIFACT structure as specified in this linked security header group.

When the referenced EDIFACT structures are secured by the same security service, with the same related security parameters many USY segments may be linked to the same security header group. In this case the link value between the security header group and the related USYs shall be the same.

When AUTACK is used for the acknowledgement function the corresponding security header group shall be either one of the referenced EDIFACT structure or of an AUTACK message that is used to provide the referenced EDIFACT structure with the authentication function.

In a USY segment the value of data element 0534 shall be identical to the value in 0534 in the corresponding USH segment of either:

- the current AUTACK, if the authentication function is used (security services: referenced EDIFACT structure origin authenticity, referenced EDIFACT structure integrity or referenced EDIFACT structure nonrepudiation of origin)
- the referenced EDIFACT structure itself, or an AUTACK message providing the referenced EDIFACT structure with the authentication function, if the acknowledgement function is used (security services: non-repudiation of receipt or receipt authentication)

0130 Segment Group 4: UST-USR (security trailer group)

A group of segments containing a link with security header segment group and the result of the security functions applied to the message/package (as defined in Part 5 of ISO 9735). USR segment may be omitted if the security trailer group is linked to a security header group related to a referenced EDIFACT structure. In this case the corresponding results of the security function shall be found in the USY segments which are linked to the relevant security header group.

0140 UST, Security trailer

A segment establishing a link between security header and security trailer segment group and stating the number of security segments contained in these groups (as defined in Part 5 of ISO 9735).

0150 USR, Security result

A segment containing the result of the security functions applied to the message/package as specified in the linked security header group (as defined in Part 5 of ISO 9735). The security result in this segment shall be applied to the AUTACK message itself.

0160 UNT, Message trailer

A service segment ending a message, giving the total number of segments and the control reference number of the message.

5.4.2 Message structure

5.4.2.1 Segment table

POS	TAG	Name	S	R	Notes

A.3.4 Simple data element specifications

Note:

Only simple data elements not defined in other parts of ISO 9735 are included here.

0571 SECURITY ERROR, CODED
Desc: Identifies the security error causing the rejection of the EDIFACT
structure.
Repr: an..3
Note 1: This element shall specify the security error encountered. These may
be the reason for non-acknowledgement by a request for secure
acknowledgement, or may be sent on the initiative of the receiver of
an AUTACK or secured EDIFACT structure which contains error.

Annex B (informative)

Service code directory

The service code directory is maintained by the UN/ECE and is part of the UN Trade Data Interchange Directory (UNTDID) and as such is not reproduced in this International Standard. The most recent version of the service code directory should be used to reference the code values for the coded data elements in the simple data element directory (see annex C within this part). The UNTDID is updated and published at regular intervals.

Annex C (informative)

AUTACK message examples

Three examples are provided herein to illustrate different applications of the AUTACK message.

The first one shows how to use an AUTACK message to secure a previously sent message, in order to provide the security service of non-repudiation of origin. An AUTACK acknowledgement message is required.

The second example shows how an AUTACK message may secure two messages with different security services : non repudiation of origin for one message, message origin authentication for an other message.

The third example illustrates the usage of AUTACK message for secure acknowledgement. It shows the AUTACK acknowledgement message required by the AUTACK in the first example.

C.1 Example 1: Non-repudiation of origin service provided by an AUTACK message

C.1.1 Narrative

Bank A wants the security service of non repudiation of origin on the payment orders from Company A, performed by Mr. Smith when they exceed a certain amount.

The interchange agreement between the parties establishes that the security service of non repudiation of origin, required by Bank A, shall be achieved for these payment orders, by Mr. Smith of Company A, with the use of one digital signature.

Both parties agree that this digital signature is computed by 512 bit RSA (asymmetric algorithm) upon a hashing value computed using the MD5 algorithm.

The certificate identifying the public key of Mr. Smith is issued by an authority trusted by both parties, the certificate issuer.

In these conditions, because the digital signature of the PAYORD is included in the AUTACK message, the AUTACK itself does not need to be signed.

The PAYORD message secured by AUTACK was the third message of the first interchange sent by Mr. Smith to the Bank A. It was generated in 1996.01.15 at 10:00:00.

The AUTACK itself was the fifth message of the interchange and it was generated in 1996.01.15 at 10:05:32. The appearing security segments are the following ones:

- USH to indicate the security service applied to the PAYORD message.
- USC-USA-USA-USA-USR, the certificate of Mr. Smith.
- USB
- USX-USY with the security references and results (for PAYORD message).
- UST, without USR, referencing the USH.

C.1.2 Security details

SECURITY HEADER	
SECURITY SERVICE, CODED	Non repudiation of origin
SECURITY REFERENCE NUMBER	The reference of this header is 1
RESPONSE TYPE	Acknowledgement required: 1
FILTER FUNCTION	All binary values (signatures) are filtered with
	hexadecimal filter
ORIGINAL CHARACTER SET	The message was coded in ASCII 8 bits when its
ENCODING	signature was generated.
CERTIFICATE	certificate of Mr. SMITH
CERTIFICATE REFERENCE	This certificate is referenced, by AUTHORITY:
	0000001.
SECURITY IDENTIFICATION DETAILS	
Certificate owner	Mr. SMITH of Company A

SECURITY IDENTIFICATION DETAILS	
Certificate issuer	Mr. SMITH's certificate was generated by a certification
	Authority called: AUTHORITY.
Key name	The Public Key of AUTHORITY used to generate Mr.
	SMITH's certificate is PK1
CERTIFICATE SYNTAX VERSION	Version of certificate of UN/EDIFACT service segment
	directory.
FILTER FUNCTION	All binary values (keys and digital signatures) are filtered
	with hexadecimal filter
ORIGINAL CHARACTER SET	The credentials of the certificate were coded in ASCII 8
ENCODING	bits when the certificate was generated.
SERVICE CHARACTER FOR	Service character used when signature was computed
SIGNATURE	
Service character for signature qualifier	Service character is segment terminator.
Service character for signature	Value """ (apostrophe).
SERVICE CHARACTER FOR	Service character used when signature was computed
SIGNATURE	
Service character for signature qualifier	Service character is data element separator.
Service character for signature	Value "+" (plus sign).
SERVICE CHARACTER FOR	Service character used when signature was computed
SIGNATURE	Comiss sharestaria someosort data alamant and an
Service character for signature qualifier	Service character is component data element separator.
Service character for signature SERVICE CHARACTER FOR	Value ":" (colon).
SIGNATURE	Service character used when signature was computed
Service character for signature qualifier	Service character is repetition separator.
Service character for signature qualifier	Value "*" (asterisk).
SERVICE CHARACTER FOR	Service character used when signature was computed
SIGNATURE	Connec character used when signature was computed
Service character for signature qualifier	Service character is release character.
Service character for signature	Value "?" (question mark).
SECURITY DATE AND TIME	Certificate generation time
Date and time	Mr. SMITH certificate was generated on 931215 at
	14:12:00
SECURITY DATE AND TIME	Certificate start of validity period
Date and time	Validity period of Mr. SMITH's certificate starts: 1996 01
	01 000000
SECURITY DATE AND TIME	Certificate end of validity period
Date and time	Validity of Mr. SMITH's certificate ends: 1996 12 31
	235959
SECURITY ALGORITHM	Asymmetric algorithm used by Mr. SMITH to sign
SECURITY ALGORITHM	
Use of algorithm	An owner signing algorithm is used.
Cryptographic mode of operation	No mode of operation is relevant here.
Algorithm ALGORITHM PARAMETER	RSA is the asymmetric algorithm.
	Identifies this algorithm parameter as a Dublic exponent
Algorithm parameter qualifier	Identifies this algorithm parameter as a Public exponent for signature verification.
Algorithm parameter value	Mr SMITH's public key.
ALGORITHM PARAMETER	
Algorithm parameter qualifier	Identifies this algorithm parameter as a Modulus for
	signature verification.
Algorithm parameter value	Mr SMITH's modulus.
ALGORITHM PARAMETER	
Algorithm parameter qualifier	Identifies this algorithm parameter as the length of Mr
	SMITH's modulus (in bits).
Algorithm parameter value	Mr SMITH's modulus is 512 bits long.
SECURITY ALGORITHM	Hash function used by AUTHORITY to generate Mr
	SMITH's certificate

SECURITY ALGORITHM	
Use of algorithm	An issuer hashing algorithm is used.
Cryptographic mode of operation	Hash function CD 10118-2 Hash functions using a n- bit
	block cipher algorithm applied to provide a double
	length hash code (128 bits); initializing values:
	A = 01234567 B = 89ABCDEF
	C = FEDCBA98 D = 76543210
Algorithm	MD5 message-digest algorithm is used
SECURITY ALGORITHM	Asymmetric algorithm used by AUTHORITY to sign
SECURITY ALGORITHM	
Use of algorithm	An issuer signing algorithm is used.
Cryptographic mode of operation	No mode of operation is relevant here.
Algorithm	RSA is the asymmetric algorithm.
ALGORITHM PARAMETER	
Algorithm parameter qualifier	Identifies this algorithm parameter as a public exponent
	for signature verification.
Algorithm parameter value	AUTHORITY's public key.
ALGORITHM PARAMETER	
Algorithm parameter qualifier	Identifies this algorithm parameter as a Modulus for
	signature verification.
Algorithm parameter value	AUTHORITY's modulus.
ALGORITHM PARAMETER	
Algorithm parameter qualifier	Identifies this algorithm parameter as the length of
	AUTHORITY's modulus (in bits).
Algorithm parameter value	AUTHORITY's modulus is 512 bits long.
SECURITY RESULT	Digital signature of the certificate
VALIDATION RESULT	
Validation value qualifier	Digital signature
Validation value	512 Bit filtered hexadecimal digital signature
SECURED DATA IDENTIFICATION	
RESPONSE TYPE, CODED	A secure acknowledgement from the Bank A is required
SECURITY DATE AND TIME	A security related time-stamp of the AUTACK.
	The security time stamp is : date: 1996 01 15
	time: 10:05:32
INTERCHANGE SENDER	Identification of the interchange sender
Interchange sender identification	Identification of Mr.Smith, Company A
INTERCHANGE RECIPIENT	Identification of the interchange recipient
Interchange sender identification	Identification of Bank A
SECURITY REFERENCES	Refers to the security entity (PAYORD related with the
	service of non repudiation of origin) and its associated
	date and time.
INTERCHANGE CONTROL	Identifies the reference number assigned by the sender
REFERENCE	to the interchange of the message PAYORD: 1
INTERCHANGE SENDER	
Interchange sender identification	Identifies the sender of the interchange of the message
, v	PAYORD: Mr. Smith from Company A.
INTERCHANGE RECIPIENT	
Interchange recipient identification	Identifies the recipient of the interchange of the message
	PAYORD: Bank A
MESSAGE REFERENCE NUMBER	Identifies the reference number assigned by the sender
	to the PAYORD message: 3.
SECURITY DATE AND TIME	A security related time-stamp referring the PAYORD
Date and time	The security time stamp is date: 1996 01 15 time:
	10:00:00
SECURITY ON REFERENCES	Identifies the applicable header (associated with the
	functions of security applied to the PAYORD message),
	and the result of applying these functions to the
	PAYORD message.

SECURITY REFERENCE NUMBER	Number which links the validation result to the corresponding USH segment. In this case his value is 1.
VALIDATION RESULT	
Validation value qualifier	Digital Signature (of the PAYORD message).
Validation value	512 bit filtered hexadecimal Digital signature
SECURITY TRAILER	
SECURITY REFERENCE NUMBER	The reference of this security trailer is 1
NUMBER OF SECURITY SEGMENTS	The number of security segments is 7

C.2 Example 2: Securing several messages with AUTACK.

C.2.1 Narrative

Bank A wants the security service of non repudiation of origin on the payment orders from Company A, performed by Mr. Smith when they exceed a certain amount. For those payment orders not exceeding such amount, message origin authentication service is requested.

The interchange agreement between the parties establishes that the security service of non repudiation of origin, required by Bank A, shall be achieved for these payment orders, by Mr. Smith of Company A, with the use of one digital signature. Both parties agree that this digital signature is computed by 512 bit RSA (asymmetric algorithm) upon a hashing value computed using the MD5 algorithm.

In addition, message origin authentication will be achieved by generating a "Message Authentication Code" (MAC) with the symmetric DES according to ISO 8731-1 at the sender's site.

The certificate identifying the public key of Mr. Smith is issued by an authority trusted by both parties, the certificate issuer.

The first PAYORD message sent has to be secured with a digital signature by AUTACK. It is the fifth message of the first interchange sent by Mr. Smith to Bank A. It was sent in 1996.01.15 at 08:00:00.

The second PAYORD message sent has to be secured with a MAC by AUTACK. It is the seventh message of the first interchange. It was sent in 1996.01.15 at 09:00:00.

The AUTACK itself is the tenth message of the first interchange. It was sent in 1996.01.15 at 10:05:32. As the first PAYORD message is secured with a digital signature, the AUTACK itself does not need to be signed. In consequence, the appearing security segments are the following ones:

- USH to indicate the non-repudiation of origin service applied to the first PAYORD message.
- USC-USA-USA-USA-USR, the certificate of Mr. Smith.
- USH to indicate the message origin authentication service applied to the second PAYORD message.
- USB
- USX-USY with the security references and result (digital signature) for the first PAYORD message.
- USX-USY with the security references and result (MAC) for the second PAYORD message.
- UST, without USR, referencing the first USH.
- UST, without USR, referencing the second USH.

C.2.2 Security details

SECURITY HEADER	Header containing information of the security function performed on the referenced entity (first PAYORD message)
SECURITY SERVICE, CODED	Non repudiation of origin for the first PAYORD
SECURITY REFERENCE NUMBER	The reference of this header is 1
FILTER FUNCTION	All binary values are filtered with hexadecimal filter
ORIGINAL CHARACTER SET	The message was coded in ASCII 8 bits when its
ENCODING	signature was generated.
SECURITY IDENTIFICATION DETAILS	
Message sender	Mr. Smith from Company A
SECURITY IDENTIFICATION DETAILS	
Message receiver	Bank A

	235959
SECURITY ALGORITHM	Asymmetric algorithm used by Mr. SMITH to sign
SECURITY ALGORITHM	
Use of algorithm	An owner signing algorithm is used.
Cryptographic mode of operation	No mode of operation is relevant here.
Algorithm	RSA is the asymmetric algorithm.
ALGORITHM PARAMETER	
Algorithm parameter qualifier	Identifies this algorithm parameter as a Public exponent
	for signature verification.
Algorithm parameter value	Mr SMITH's public key.
ALGORITHM PARAMETER	
Algorithm parameter qualifier	Identifies this algorithm parameter as a Modulus for
	signature verification.
Algorithm parameter value	Mr SMITH's modulus.
ALGORITHM PARAMETER	
Algorithm parameter qualifier	Identifies this algorithm parameter as the length of Mr
	SMITH's modulus (in bits).
Algorithm parameter value	Mr SMITH's modulus is 512 bits long.

SECURITY ALGORITHM	Hash function used by AUTHORITY to generate Mr
	SMITH's certificate
SECURITY ALGORITHM	
Use of algorithm	An issuer hashing algorithm is used.
Cryptographic mode of operation	Hash function CD 10118-2 Hash functions using a n- bit
	block cipher algorithm applied to provide a double
	length hash code (128 bits); initializing values:
	A = 01234567 B = 89ABCDEF C = FEDCBA98 D = 76543210
Algorithm	MD5 message-digest algorithm is used
SECURITY ALGORITHM	Asymmetric algorithm used by AUTHORITY to sign
SECURITY ALGORITHM	
Use of algorithm	An issuer signing algorithm is used.
Cryptographic mode of operation	No mode of operation is relevant here.
Algorithm	RSA is the asymmetric algorithm.
ALGORITHM PARAMETER	
Algorithm parameter qualifier	Identifies this algorithm parameter as a public exponent
Algorithm perometer visitio	for signature verification.
Algorithm parameter value	AUTHORITY's public key.
Algorithm parameter qualifier	Identifies this algorithm parameter as a Modulus for
	signature verification.
Algorithm parameter value	AUTHORITY's modulus.
ALGORITHM PARAMETER	
Algorithm parameter qualifier	Identifies this algorithm parameter as the length of
	AUTHORITY's modulus (in bits).
Algorithm parameter value	AUTHORITY's modulus is 512 bits long.
SECURITY RESULT	Digital signature of the certificate
VALIDATION RESULT	
Validation value qualifier	Digital signature
Validation value SECURITY HEADER	512 Bit filtered hexadecimal digital signature Header containing information of the security function
SECORITI HEADER	performed on the referenced entity (second PAYORD
	message)
SECURITY SERVICE, CODED	Message origin authentication for the second PAYORD
SECURITY REFERENCE NUMBER	The reference of this header is 2
FILTER FUNCTION	All binary values are filtered with hexadecimal filter
SECURITY IDENTIFICATION DETAILS	
Message sender	Mr. Smith from Company A
SECURITY IDENTIFICATION DETAILS	
	Bank A
SECURITY ALGORITHM	
Use of algorithm	A symmetric algorithm is used to achieve message origin
Cryptographic mode of operation	A symmetric algorithm is used to achieve message origin authentication.
	A MAC is computed, according to ISO 8731-1.
Algorithm	The DES algorithm is used.
ALGORITHM PARAMETER	
Algorithm parameter qualifier	Identifies this algorithm parameter values as the name of
	a previously exchanged symmetric key.
Algorithm parameter value	
SECURED DATA IDENTIFICATION	
RESPONSE TYPE, CODED	No acknowledgement from the Bank A is required
SECURITY DATE AND TIME	A security related timestamp of the AUTACK.
	The security time stamp is : date: 1996 01 15 time: 10:05:32
INTERCHANGE SENDER	Identification of the interchange sender
Interchange sender identification	Identification of Mr.Smith, Company A
interonange sender identification	

INTERCHANGE RECIPIENT	Identification of the interchange recipient
Interchange sender identification	Identification of Bank A
SECURITY REFERENCES	Refers to the security entity (second PAYORD).
INTERCHANGE CONTROL	Identifies the reference number assigned by the sender
	to the interchange of the second PAYORD: 1
INTERCHANGE SENDER Interchange sender identification	Identifies the sender of the interchange of the message PAYORD: Mr. Smith from Company A.
INTERCHANGE RECIPIENT Interchange recipient identification	Identifies the recipient of the interchange of the message PAYORD: Bank A
MESSAGE REFERENCE NUMBER	Identifies the reference number assigned by the sender to the second PAYORD message: 7.
SECURITY DATE AND TIME	The security time stamp is: date: 1996 01 15 time: 09:00:00
SECURITY ON REFERENCES	Identifies the applicable header (associated with the functions of security applied to the second PAYORD message), and the result of applying these functions to it.
SECURITY REFERENCE NUMBER	Number which links the validation result to the corresponding USH segment. In this case his value is 2.
VALIDATION RESULT	
Validation value qualifier	
Validation value	MAC (Message Authentication Code).
SECURITY REFERENCES	Refers to the security entity (the first PAYORD) and its associated date and time.
INTERCHANGE CONTROL	Identifies the reference number assigned by the sender
REFERENCE	to the interchange of the message PAYORD: 1
INTERCHANGE SENDER Interchange sender identification	Identifies the sender of the interchange of the message PAYORD: Mr. Smith from Company A.
INTERCHANGE RECIPIENT Interchange recipient identification	Identifies the recipient of the interchange of the message PAYORD: Bank A
MESSAGE REFERENCE NUMBER	Identifies the reference number assigned by the sender to the first PAYORD message: 5.
SECURITY DATE AND TIME	The security time stamp is: date: 1996 01 15 time: 08:00:00
SECURITY ON REFERENCES	Identifies the applicable header (associated with the functions of security applied to the first PAYORD message) and the result of applying these functions to it.
SECURITY REFERENCE NUMBER	Number which links the validation result to the corresponding USH segment. In this case his value is 1.
VALIDATION RESULT	
Validation value qualifier	
Validation value	Digital Signature (of the first PAYORD message). 512 bit filtered hexadecimal Digital signature
SECURITY TRAILER	
SECURITY REFERENCE NUMBER	The reference of this security trailer is 2
NUMBER OF SECURITY SEGMENTS	The number of security segments is 2
SECURITY TRAILER	
SECURITY REFERENCE NUMBER	The reference of this security trailer is 1
NUMBER OF SECURITY SEGMENTS	The number of security segments is 7

C.3 Example 3: Secure acknowledgement of a received message by AUTACK

C.3.1 Narrative

In the example 1, AUTACK was used by the sender (Mr. Smith of Company A) of a previous message PAYORD. The AUTACK message requested an acknowledgement to Bank A.

In this example, it is shown how the AUTACK message is used as secure acknowledgement.

It has been established that AUTACK messages acting as secure acknowledgement will be protected with the non repudiation of origin, by using a digital signature.

The AUTACK message is generated in 1996.01.16 at 11:00:00, being the 20th message from the interchange. The appearing security segments are the following ones:

- USH, to identify the security service applied to the AUTACK message.
- USH, to identify the security service applied to the entity acknowledged.
- USC-USA(3)-USR, the certificate of Bank A.
- USB, to contain details of the AUTACK.
- USX-USY, to contain references to the acknowledged entity and the digital signature.
- UST, the Security Trailer without USR.
- UST-USR to secure the AUTACK itself.

C.3.2 Security details

SECURITY HEADER	
SECURITY SERVICE, CODED	Non repudiation of origin

Annex D (informative) Security services and algorithms

D.1 Purpose and scope

Annex D gives examples of possible combinations of data elements and code values from the security segment groups. These examples have been chosen to illustrate some widely used security techniques, based on international standards.

The full set of possible combinations is far too large to be presented in this annex. The choices made here must not be considered as an endorsement of the algorithms or modes of operation. The user is invited to choose the techniques appropriate to the security threats he wants to be protected against.

The purpose of this annex is to provide the user, once he has chosen the security techniques, with a comprehensive starting point to work out a suitable solution for his particular application.

For easier reading and understanding the subject has been divided into three paragraphs, each of which concentrates on different basic principles for applying security.

The two sets are:

- 1. Combinations using symmetric algorithms and AUTACK for referenced entities
- 2. Combinations using asymmetric algorithms and AUTACK for referenced entities
- 3. Combinations using AUTACK for acknowledgement

List of codes used in the matrixes (subset of the complete code list)

0501 1 2 9	Security service, coded Non-repudiation of origin Message origin authentication Referenced EDIFACT structure integrity	0505 6	<i>Filter function, coded</i> UN/EDIFACT EDC filter
0523 1 2 3 4 6	Use of algorithm, coded Owner hashing Owner symmetric Issuer signing (CA) Issuer hashing (CA) Owner signing	0525 6 9 11	<i>Cryptographic mode of operation, coded</i> MAC (Message Authentication Code) MDC2 (Modification Detection Code) HDS2 (Hash functions)

0563 1	<i>Validation value qualifier</i> Unique validation value	0577 1 2 3 4	Security party qualifier Message sender Message receiver Certificate owner Authenticating party

Abbreviations, used

a, b, c, d	=	Representations of a Security Reference Number
CA	=	Certification Authority
Enc-Key	=	Encrypted Key
Hash	=	Hash value
Key-N	=	Key Name
MÁC	=	Message authenticating code
Mod	=	Modulus
Mod-L	=	Length of Modulus
PK/CA	=	Public Key of Certification Authority
Pub-K	=	Public Key
Sig	=	Signature

D.2 Combinations using symmetric algorithms and AUTACK for referenced entities

The following matrix establishes the relationships for the specific cases of

- referenced entity security provided by AUTACK message (ISO 9735-6)
- use of symmetric algorithm only
- the security services provided are referenced EDIFACT structure origin authentication for the referenced message and message origin authentication for the AUTACK message. Referenced EDIFACT structure origin authentication is provided by the combination of referenced EDIFACT structure integrity and message origin authentication of the AUTACK
- referenced EDIFACT structure integrity is provided by a hash function based on DES algorithm used in MDC mode, according to ISO 10118-2. There is no secret key to be shared between the sender and the receiver. The hash value is conveyed in the AUTACK and is protected by the security on the AUTACK message.
- message origin authentication for the AUTACK is provided by computing a MAC (Message Authentication Code) on the AUTACK message. In this example, the algorithm used is DES in CBC mode with a secret key which is known by the message receiver and is only referred to by a key name. This example complies to ISO 8731-1.
- although sender and receiver share keys, the cryptographic mechanisms have not been completely agreed beforehand. Therefore all the algorithms and mode of operation used are explicitly named.
- only the security fields related to security techniques, algorithms and modes of operation actually used are shown.

Table D.1 - Matrix of relationship when only symmetric algorithms are used

Notes:

- 1. one security header refers to the AUTACK security trailer and the other to the security on references segment
- 2. message sender
- 3. name of the secret key shared by sender and receiver of the AUTACK
- 4. message receiver
- 5. refers to one of the security headers
- 6. hash value computed on the referenced EDIFACT structure. It is protected by the MAC computed on the AUTACK message
- 7. refers to one of the security headers
- 8. MAC computed on the AUTACK message
- * further code combinations are possible and required

D.3 Combinations using asymmetric keys and AUTACK for referenced entities

The following matrix establishes the relationships for the specific cases of

- referenced entity security provided by AUTACK message (9735-6)
- the security services provided are referenced EDIFACT structure non-repudiation of origin and message non-repudiation of origin for the AUTACK message. Referenced EDIFACT structure non-repudiation of origin is provided by the combination of referenced EDIFACT structure integrity and non-repudiation of origin of the AUTACK
- the asymmetric algorithm is RSA
- the hash-function is DES algorithm in MDC mode. The same hash function is used to compute the hash value on the referenced EDIFACT structure and on the AUTACK message
- certificates are assumed to not have been exchanged previously
- the USC segment contains explicitly the identification of the hash function and the signature function used by the Certification Authority to sign the certificate. The public key of Certification Authority, needed to check the certificate signature is already known by the receiver. It is referred to by name in the USC segment.
- only one certificate is included, a second one would be necessary, only if a public key of the recipient were used

Table D.2 - Matrix of relationship when asymmetric algorithms are used

Table D.2 - Matrix of relationship when asymmetric algorithms are used (concluded)

Notes:

- 1. Message origin authentication and Integrity for AUTACK are assumed to be included in the Non-repudiation of origin. Referenced EDIFACT structure non-repudiation of origin is provided by the combination of referenced EDIFACT structure integrity and AUTACK non-repudiation of origin
- 2. message sender
- message receiver 3.
- hash function applied by the sender on the secured structure 4.
- certificate owner: identification details should be the same 6.
- as in USH S500 for the message sender
- 7. authenticating party: Certification Authority (CA)
- sender's signature function 8. 9.
- CA's hash function
- 10. CA's signature function
- 11. some signature algorithms (for instance DSA) require 2 result parameters

ISO 9735-6

* further code combinations are possible and required

D.4 Combinations using AUTACK for acknowledgements

The combinations possible for acknowledgement AUTACKs follow the above described cases.

In particular:

- for USH 0501 code 6 (receipt authentication), the combinations of matrix 1 apply
- for USH 0501 code 5 (non-repudiation of receipt), the combinations of matrix 2 apply

Note :

Further code combinations are possible and required.
